

General Description

The LTA391/LTA2903/LTA2901 are single-, dual-, quad- channel comparators that feature 250 μ A quiescent current, a wide range of supply voltages from 2.0V to 36V with rail-to-rail inputs helps to implement in a wide variety of applications where require critical response time, power-sensitive, high-voltage. The output of the LTA391/LTA2903/LTA2901 could be connected to other open-collector outputs to achieve wired-AND relationship. All input and output pins can tolerate a continuous short-circuit fault condition to either rail.

The LTA391 (Single) is available in SOT23-5L package. The LTA2903 (Dual) is offered in TSSOP-8L, SOIC-8L, DFN 3*3-8L and MSOP-8L packages, The LTA2901 (Quad) is offered in SOIC-14L, TSSOP-14L and DFN 3*3-16L packages. All devices are rated over -40°C to $+125^{\circ}\text{C}$ extended industrial temperature range.

Features and Benefits

- 2.0V to 36V Single supply or $\pm 1.0\text{V}$ to $\pm 18\text{V}$ Dual supply
- Low quiescent current: 250 μ A
- Common-mode input voltage range includes Ground
- Differential input voltage range equal to power supply
- -40°C to 125°C Operation temperature
- available in packages: SOT23-5L, SOIC-8L, TSSOP-8L, MSOP-8L, DFN-8L, SOIC-14L, TSSOP-14L, DFN-16L
- Output Compatible with TTL, MOS, CMOS logic levels

Applications

- Industrial Application
- Solar Inverter
- White Goods
- Battery Management System
- Medical Equipment

Revision History

Version FN1623-49.2 (Jan,2024)

- Remove “LTA331” in this version datasheet.Rename “LTA391U” for replacement.
- Add “LTA391R” in this version.
- Change supply voltage from minimum 2.5V to 2.0V.
- Update “Electrical Characteristics”
- Update “Typical Characteristics” Figure 4 and Figure 5.

Version FN1623-49.1 (Jan,2024)

- Add ECO Class to “Order information”
- Add Specified Voltage to “Electrical Characteristics ---LTA2903”

Version FN1623-49.0 (Dec,2023)

- Initial version.

Limiting Value– In accordance with the Absolute Maximum Rating System (IEC 60134)

Parameter	Absolute Maximum Rating
Supply Voltage, V_{S+} to V_{S-}	36 V
Differential input voltage	± 36 V
Input voltage range (either input)	-0.3 to 38 V
Input current	-50 mA
Output voltage	36 V
Output current	20 mA
Storage Temperature Range, T_{stg}	-65 °C to +150 °C
Junction Temperature, T_J	150 °C
Lead Temperature Range (Soldering 10 sec)	260 °C

ESD Ratings

Parameter	Level	UNIT
Human body model (HBM), per ESDA/JEDEC JS-001-2017 ⁽¹⁾	$\pm 1\,500$	V
Charged device model (CDM), per ESDA/JEDEC JS-002-2018 ⁽²⁾	± 750	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible if necessary precautions are taken.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible if necessary precautions are taken.

Input offset voltage	V _{OS}	V _{IC} = V _{ICR} min, V _O = 1.4 V, V _{CC} = 5 V to V _{CC} MAX, T _A = 25 °C		1		mV
		V _{IC} = V _{ICR} min, V _O = 1.4 V, V _{CC} = 5 V to V _{CC} MAX, T _A = -40 to +125 °C		2		
INPUT BIAS CURRENT						
Input bias current	I _B	I _{IN} (+)-I _{IN} (-) with Output in Linear range V _{CM} =0 V ⁽¹⁾		22		nA
Input offset current	I _{OS}	I _{IN} (+)-I _{IN} (-) V _{CM} =0 V		1		nA
INPUT VOLTAGE						
Common-mode voltage range	V _{CM}	V _{CC} =30 V ⁽²⁾	-0.3		V _{CC} -1.4	V
OPEN-LOOP GAIN						
Large-signal differential-voltage amplification	A _{VD}	V _{CC} = 15 V, V _O = 1.4 V to 11.4 V, R _L ≥ 15 kΩ to V _{CC} , T _A = 25 °C		25	100	V/mV
OUTPUT						
Low output voltage swing	V _{OL}	V _{ID} = -1 V, I _{OL} = 4 mA		152	370	mV
High-level output current	I _{OH}	V _{ID} = 1 V, V _{OH} = 5 V		0.1		nA
Low-level output current	I _{OL}	V _{ID} = -1 V, V _{OL} = 1.5 V	6	16		mA
POWER SUPPLY						
Specified Voltage	V _s		2.0		36	V
Supply current(one comparator)	I _{CC}	V _O = 2.5 V, No load V _{CC} = 5 V		0.23	0.5	mA
		V _O = 2.5 V, No load, V _{CC} = MAX		0.28	0.63	

At $T_A = 25^\circ\text{C}$ and $V_S = 5\text{ V}$, unless otherwise noted.

Parameter	Symbol	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Propagation delay time	$T_{(pd)}$	$V_{RL} = 5\text{ V, } R_L = 5.1\text{ k}\Omega$		1.4		μs
		$V_{IN} = \text{TTL Logic Swing, } V_{REF} = 1.4\text{ V}$		330		ns

(1) The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the reference or input lines.

(2) The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is $V_{CC} - 1.5\text{ V}$ at 25°C , but either or both inputs can go to 36 V without damage, independent of the magnitude of V_{CC} .

Typical Characteristics -- LTA2903

At $T_A = +25^\circ\text{C}$, $V_{CM} = V_S/2$, and $R_L = 10\text{ k}\Omega$ connected to $V_S/2$, unless otherwise noted.

Detailed Description

Operating Voltage

The LTA391 / LTA2903 / LTA2901 family of 36V General-purpose low power comparators is fully specified and ensured for operation from 2.0 to 36V and offers an excellent speed-to-power combination with propagation delay of 1 μ s and a quiescent supply current of 250 μ A. The open-drain output allows the user to configure the output logic low voltage (V_{OL}) and allows the comparator to be used in AND functionality.

In addition, many specifications apply over the industrial temperature range of -40°C to $+85^{\circ}\text{C}$, parameters that vary significantly with operating voltages or temperature are illustrated in the Typical Characteristics graphs.

Maximizing performance through proper layout

To achieve the maximum performance of the extremely high input impedance and low offset voltage of the LTA391 / LTA2903 / LTA2901 devices, care is needed in laying out the circuit board. The PCB surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board reduces surface moisture and provides a humidity barrier, reducing parasitic resistance on the board. The use of guard rings around the comparator inputs further reduces leakage currents. Figure 6 shows proper guard ring configuration and the top view of a surface-mount layout. The guard ring does not need to be a specific width, but it should form a continuous loop around both input. By setting the guard ring voltage equal to the voltage at the non-inverting input, parasitic capacitance is minimized as well. For further reduction of leakage currents, components can be mounted to the PCB using Teflon standoff insulators.

Other potential sources of offset error are thermo-electric voltages on the circuit board. This voltage, also called Seebeck voltage, occurs at the junction of two dissimilar metals and is proportional to the temperature of the junction. The most common metallic junctions on a circuit board are solder-to-board trace and solder-to-component lead. If the temperature of the PCB at one end of the component is different from the temperature at the other end, the resulting Seebeck voltages are not equal, resulting in a thermal voltage error. This thermocouple error can be reduced by using dummy components to match the thermoelectric error source. Placing the dummy component as close as possible to its partner ensures both Seebeck voltages are equal, thus canceling the thermocouple error. Maintaining a constant ambient temperature on the circuit board further reduces this error. The use of a ground plane helps distribute heat throughout the board and reduces EMI noise pickup.

Figure 6: Use a guard ring around sensitive pins

Input and Output coupling

To minimize capacitive coupling, the input and output signal traces should not be parallel. This helps reduce unwanted positive feedback.

Typical Application Circuits

Window Comparator

Window Comparators are commonly used to detect undervoltage (UV) and overvoltage (OV) conditions. Figure 7 shows a simple window comparator circuit.

For this design, follow these design requirements:

- Alert (logic low output) when an input signal is less than 12 V
- Alert (logic low output) when an input signal is greater than 24 V
- Alert signal is active low
- Operate from a 36 V power supply

Configure the circuit as shown in Figure 7. Connect V_{S+} to a 36 V power supply and V_{S-} to ground. Make R1, R2 and R3 each 10Mohm resistors. These three resistors are used to create the positive and negative thresholds for the window comparator (V_{TH+} and V_{TH-}). With each resistor being equal, V_{TH+} is 24 V and V_{TH-} is 12 V. Large resistor values such as 10Mohm are used to minimize power consumption. The sensor output voltage is applied to the inverting and non-inverting inputs of the 2-channel LTA2903's. The respective comparator outputs will be low when the sensor is less than 12V or greater than 24 V. V_{OUT} will be high when the sensor is in the range of 12 V to 24 V. See the application curve in Figure 8.

Important Notice

Linearin is a global fabless semiconductor company specializing in advanced high-performance high-quality analog/mixed-signal IC products and sensor solutions. The company is devoted to the innovation of high performance, analog-intensive sensor front-end products and modular sensor solutions, applied in multi-market of medical & wearable devices, smart home, sensing of IoT, intelligent industrial & smart factory (industry 4.0), and automotives. Linearin's product families include widely-used standard catalog products, solution-based application specific standard products (ASSPs) and sensor modules that help customers achieve faster time-to-market products. Go to <http://www.linearin.com> for a complete list of Linearin product families. For additional product information, or full datasheet, please contact with the Linearin's Sales Department or Representatives.
